BASIC INVOICES AND PAYMENT PLANS	55

INTRODUCTION

This document is for merchants who are interested in accepting card, bank, invoice, payment plan, or e-wallet payments from their customers. The payments will go through our payment gateway, which redirects the customer to their bank, a card service provider, or a payment service provider, where the customer can complete the payment.

There are also other ways to integrate with Svea's payment services, like using a module or integration package, but those are described in other documents.

INTEGRATION USING MODULES OR INTEGRATION PACKAGES

MODULES

Svea Ekonomi has developed module plug-ins to a number of e-commerce platforms. For a shop that uses one of those platforms, this is the easiest way to get started. The list of modules can be found at <https://www.svea.com/se/sv/foretag/betallosningar/betallosningar-for-e-handel/tech-site>.

INTEGRATION PACKAGES

To create a unified API for all kinds of payments, Svea Ekonomi has developed code libraries for PHP, Java, and C# that the merchant can import and call from their own code. These can be downloaded from GitHub at <https://github.com/sveawebpay>. Look for the repositories called php-integration, java-integration, and dotnet-integration. There is a button to download as a zip file for those who do not use git.

For card, bank, and e-wallet payments, the integration packages will communicate with the payment gateway. For invoice and payment plan payments, they will bypass the payment gateway and communicate directly with Svea's invoice and payment plan system.

INTEGRATING WITH THE PAYMENT GATEWAY API

If the merchant wants more control of the integration, they can bypass the modules and integration packages and integrate with the payment gateway API directly. This includes making payment requests directly to Payment Gateway, to integrate with our webservices, and to be prepared to receive callbacks from Payment Gateway. These things are what the rest of this document is about.

PAYMENTS

To initiate a payment, the merchant sends the customer to Payment Gateway with a POST request. Payment Gateway will then in turn redirect the customer to the end destination, which can be e.g. a bank or a card payment provider. Depending on the payment type, the customer might have to do something there to complete the payment. E.g. if it is a card payment, they might have to fill in their credit card number etc.

After the request has been handled, the customer will normally be sent back to the return URL that was specified in the payment request. If the merchant has specified a callback URL, a separate callback will also be sent, with the same information.

URL for **test payments** is:

<https://webpaypaymentgatewaystage.svea.com/webpay/payment>

URL for **production payments** is:

<https://webpaypaymentgateway.svea.com/webpay/payment>

THE PAYMENT REQUEST

The request should contain the following parameters:

HTTP POST	
Parameter name	Description
merchantid	Your Merchant ID
message	Payment information, Base64-encoded
mac	Checksum

- merchantid - is the store ID that you received from your integrator.
- message - contains the Base64 encoded XML you have generated as described in the section The Payment Request Structure.
- mac – a code that is calculated in order to verify the sender of the call. To generate it, you must have received a secret word from your integrator. See more under the section MAC.

Example:

```
<form name='form' method='post' action='https://webpaypaymentgatewaystage.svea.com/webpay/payment'>
<input type='hidden' name='merchantid' value='1100' />
<input type='hidden' name='message' value='Jmx0Oz94bWwgdMvyc2lvbj0iMS4wliBlbmNvZGluz0iVVRGLTgiJmd0OyAKJmx0O3BheW1lbnQmZ3Q7IAombHQ7bWVzc2FnZSZndDsgCiZsdDtwYXItZW50TWV0aG9kZmJmd0O0tPUIQmbHQ7L3BheW1lbnRnZXRob2QmZ3Q7IAombHQ7Y3VycmVuY3kmZ3Q7U0VLJmx0Oy9jdXJyZW5jeSZndDsKJmx0O2Ftb3VudCndDs3MzMwMwMCZsdDsvYW1vdW50Jmd0OyAKJmx0O2N1c3RvbWVycmVmbm8mZ3Q7dGVzdDEyMyZsdDsvY3VzdG9tZXJyZWZubyZndDsKJmx0O3JldHVybnVybCZndDtodHRwOi8vbG9jYXRob3N0OjgwODgvZXBheW1lbnQvcGF5bWVudCZsdDsvcmV0dXJudXJsJmd0OyAKJmx0Oy9tZXNzYWdlJmd0OyAKJmx0Oy9wYXItZW50Jmd0Ow==' />
<input type='hidden' name='mac' value='df74ce933f1d367d4100b4d34ad6970760c6040e13d49b94b36bd81239c2c3a724435ab5dc4e1065c861944f9a1e56fa1f53f1cd22d71564e69d5256fba24d43' />
</form>
```

THE PAYMENT REQUEST STRUCTURE

The call is structured in XML with the root element <payment>. It contains all information about the payment.

<payment>				
Element name	Content	Value	Format	Mandatory
paymentmethod	Payment method	See Appendix 1	AN(32)	
lang	Language on pay page	Supported languages: da, de, en, es, fi, fr, it, nl, no, pl, sv	AN(2)	
currency	Currency	ISO 4217 alphabetical upper-case (e.g. SEK)	AN(3)	Y
amount	Total amount in minor currency, including VAT	E.g. 1001	N	Y
vat	VAT in minor currency	E.g. 200	N	
customerrefno	Merchant ref.nr	Free text	AN(64)	Y
returnurl	Return URL	Free text	AN(256)	Y
callbackurl	Callback URL	Free text, system configuration requirements are described in the Callback section in this document.	AN(256)	
subscriptiontype	Type of subscription	See recurring card payments	AN(64)	
simulatorcode	Desired statuscode. Only used for testing	E.g. 0	N	
externalpaymentref	Reference to be sent to card acquirer	Only characters a-z,A-Z and 0-9	AN(15)	
excludepaymentmethods	Methods to exclude	List of <exclude> elements	Complex type	
customer	Customer data	See Appendix 1	Complex type	
orderrows	Orderrows	List of <row> element	Complex type	
payeralias	Cellular phone number	E.g. 46701234567	N	
storedcardalias	The alias for the stored card	GUID	AN(36)	Y
showstorecarddialog	Allow customer to store carddetails for later use. Defaults to false.	e.g. true	Boolean	

<lang>

The available languages are:

da – Danish, de – German, en – English (incl. USA), es – Spanish, fi – Finnish, fr – French, it – Italian, no – Norwegian, pl – Polish, sv – Swedish

If the <lang> element is not used, the value will default to the language used in the browser.

Please note that amount is in minor currency, including VAT. For example, if the currency is SEK, 1001 in minor currency equals 10.01 SEK. For the currency of Island, the smallest unit is 1 ISK, which becomes “100” in the xml.

Example: Suppose that the product price is 4 SEK, excluding VAT. If the VAT percentage is 25%, the VAT will be 1 SEK, so the total amount will be 5 SEK. The elements for amount and VAT will be:

```
<amount>500</amount>
<vat>100</vat>
```

The `<simulatorcode>` element is used in the test environment only. It is used to simulate a response code, e.g. 0, which means SUCCESS. In the production environment this element is ignored.

`<excludepaymentmethods>`

This element holds a list of payment methods that are not to be presented as payment choices. Each payment method is contained in a separate exclude element.

<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>
<code><exclude></code>	Payment method	See Appendix 1	AN(32)	

Example:

```
<excludepaymentmethods><exclude>PAYPAL</exclude><exclude>SVEAINVOICEEU_SE</exclude>
</excludepaymentmethods>
```

`<externalpaymentref>`

This optional element is only valid for the payment method SVEACARDPAY. It is a reference to be sent to the acquirer to be displayed on reconciliations reports. Please note that it may only contain characters a-z, A-Z and 0-9 with a maximum length of 15. If any other characters are given, or length exceeds 15 characters, the payment request will be rejected.

`<payeralias>`

This element is only valid for the payment methods SWISH and VIPPS and it is mandatory. The payeralias elements contains the customers cellular phone number in international format. For more information, see chapter SWISH and VIPPS PAYMENTS.

`<storedcardalias>`

This element is optionally used for the payment method SVEACARDPAY and SVEACARDPAY_PF. The step where card data is entered is skipped if storedcardalias is used but 3DSecure authentication is still required.

`<showstorecarddialog>`

This element is only valid for the payment methods SVEACARDPAY and SVEACARDPAY_PF. If set to true a checkbox will be displayed on the card-payment page with a disclaimer stating that the customer can store their card in order to simplify upcoming payments.

ORDER ROWS

Order rows are used to send information about the products. Each order row is represented by a row element `<row>`. Row elements are all contained in the element `<orderrows>`.

<code><row></code>				
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>
name	Product name	Free text	AN(256)	Y
description	Product description	Free text	AN(512)	
amount	Amount per item in minor currency, including VAT	e.g. 1001	N	Y
vat	VAT per item in minor currency	e.g. 200	N	
quantity	Quantity	e.g. 5	N	
sku	Article number	Free text	AN(256)	Y
unit	Unit	Free text (e.g. st)	AN(64)	

8 (57) Payment Gateway API V 2.9.2

Please note that amount is in minor currency, including VAT. For example, if the currency is SEK, 1001 in minor currency equals 10.01 SEK.

PAYPAGE

To show our hosted pay page, where the consumer can choose their desired payment method, exclude the element <paymentmethod> from the request. Only payment methods that are available for the merchant will be shown. Also, only payment methods for which the payment is valid will be shown. E.g. payment plan methods will not be shown if the amount is too small.

Example from the pay page, with some payment methods

Pay later

 **PARTPAYMENT**

 **INVOICE**

Pay now

 Amount 5,000.00 SEK

PAYMENT RESPONSE MESSAGE

After performing the payment, the consumer is redirected back to the store's returnUrl through a HTTP POST or a HTTP GET (a variation is when rescue payment is activated, see RESCUE PAYMENT for details). Please contact your premium user to choose the required response type.

The response contains the following parameters:

POST/GET Parameters	
response	PD94bWwgdMvyc2lvbj0iMS4wliBlbmNvZGluZz0iVVRGLTgiPz48cmVzcG9uc2U+PHRyYW5zYWN0aW9uIGlkPSI1MjM4NjliPjxwYXltZW50bWV0aG9kPkRCTk9SREVBUEU08L3BheW1lbnRtZXRob2Q+PG1lcmNoYW50aWQ+MTEwOTwvbWVvYyY2hhbnRpZD48Y3VzdG9tZXJyZWZubz5yZUdFUkdIUlJldGg8L2N1c3RvbWVycmVmbm8+PGFtb3VudD41MDAwMTwvYW1vdW50PjxdXJyZW5jeT5TRUs8L2N1cnJlbnN5PjwvZG90YXR1c2NvZGU+MDwvc3RhdHVzY29kZT48L3Jlc3BvbNIPg==
mac	88cea01f3c1acfcbb40c532ea8be1b0027f77f7d92586619672720ac80d8c6f09bb0c51bbc8b07f2958d64633e36ee938a82fa532d393c0aaa297579829576f8
merchantid	1109

- response - Base64 encoded message (that needs to be decoded)
- mac – calculated mac (see section MAC)
- merchantid - your merchantid that you have received from the integrator

The response parameter contains the Base64 encoded XML message that contains a <response> root element. It contains information about the payment status.

<response>			
Element name	Description	Value	Format
transaction	Optional attribute id containing the Transaction ID	Complex type	Complex type
statuscode	Status of the payment request	See Appendix 1	N

The <transaction> element contains some values:

<transaction>			
Element name	Description	Value	Format
paymentmethod	Payment method	See Appendix 1	AN(32)
merchantid	ID of the merchant		N
customerrefno	ID given by the merchant	Free text	AN(64)
amount	Total amount in minor currency, including VAT	e.g. 1001	N
currency	Currency	ISO 4217 (e.g. SEK)	AN(3)
subscriptionid	Subscription ID (optional)	e.g. 2002	N
subscriptiontype	Subscription type (optional)	e.g. RECURRINGCAPTURE	AN(64)

Please note that amount is in minor currency, including VAT. For example, if the currency is SEK, 1001 in minor currency equals 10.01 SEK.

In some cases, the transaction will not be assigned an ID. This happens when the payment page is used and, for some reason, the transaction is stopped at an early stage, before the payment method is chosen by the customer. These orders are discarded and will not show up in the transaction list in the admin GUI.

Subscription ID and Subscription type are only returned if it's a subscription payment.

RESCUE PAYMENT

If rescue payment is activated for the merchant via a setting in the admin console, a payment that fails at the payment provider, or is cancelled by the customer, will result in a redirect to the PayPage instead of a redirect back to the merchant site. In this case, any selected or excluded payment methods are cleared from the original payment specification, and *all* active payment methods will be shown on the PayPage.

Every new payment attempt will result in a new transaction, hence there might be several failed transactions tied to one <customerrefno>.

CALLBACK

A callback is a message that is sent to the merchant. The sending of this message is initiated by the Payment Gateway.

- Certificates, if used on the merchant's system, should be signed by well-known Certificate Authorities.
- The callback URL must use one of these ports: 80 or 443.
- The hostname that should receive that callback must be communicated to Svea Ekonomi for whitelisting.
- If the integrating party uses ip filtering, whitelisting or similar, ip range 193.13.207.0/24 must be allowed for incoming callback messages.

CALLBACK, PAYMENT RESPONSE

This callback is an additional response message that is sent to the callback URL of the merchant, with the same format as the response message. It is always sent as a POST. It is for merchants who want to be sure to receive a response even if the normal response message has not been sent. This could happen e.g. if a user that has been redirected to a bank closes their browser before completing the payment, or before being redirected back to the merchant. It may take several minutes before the callback message is sent. If enabled, a callback is always sent, even when the normal response message has also been sent. Even though it is not necessary, we recommend everyone to use the callback functionality if possible.

If a callback URL was not given in the payment message, the default callback URL that may have been configured for the merchant will be used instead. If no callback URL has been given anywhere, no callback will be sent.

NOTE: If callback urls are set dynamically (in the payment request) then all domains/hosts used must be communicated to Svea Ekonomi for whitelisting.

CALLBACK, STORED CARD ALIAS EXPIRED

A merchant who uses the store card functionality may choose to handle the callback with information about expired card alias, i.e. the card alias cannot be used for further payments.

The callback URL is configured on merchant level in the payment gateway.

The callback URL must not use other ports than: 80 or 443. It is always sent as a POST.

Certificates, if used, on the merchant's system should be signed by well-known Certificate Authorities.

The hostname that should receive that callback must be communicated to Svea Ekonomi for whitelisting.

If the integrating party uses ip filtering, whitelisting or similar, ip range 193.13.207.0/24 must be allowed for incoming traffic.

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<expiredcardalias>
```

12 (57) Payment Gateway API V 2.9.2

```
<storedcardalias>21ff4c0e-b398-42c3-9a60-f971dde92b95</storedcardalias>  
</expiredcardalias>
```

DIRECT BANK PAYMENTS

To redirect the customer to the homepage of an Internet bank, so that they can pay via that bank, use the payment method for that bank. For available banks, see Appendix 1.

Example XML-message

```
<?xml version="1.0" encoding="UTF-8"?>
<payment>
<paymentmethod>DBNORDEASE</paymentmethod>
<currency>SEK</currency>
<amount>500</amount>
<vat>100</vat>
<customerrefno> unique_id</customerrefno>
<returnurl>https://webpaypaymentgatewaystage.svea.com/webpay-
admin/admin/merchantresponsetest.xhtml</returnurl>
<orderrows>
  <row>
    <name>ASUS P8P67 PRO Socket-1155</name>
    <amount>1000</amount>
    <vat>200</vat>
    <quantity>1</quantity>
    <sku>SK-54f-3S23-AB</sku>
    <unit>st</unit>
    <description>ATX P67 DDR3 3xPCIe(2.0)x16 CFX SLI SATA 6Gb/s</description>
  </row>
</orderrows>
</payment>
```

SWISH PAYMENTS

The customer will be redirected to a page (with a spinner symbol) where the user is asked to open the Swish-app on the device where the app is installed and sign the payment. If the swish app is installed on the same device that was used for the payment the app can be opened directly by clicking a button "Open Swish".

On this page there is a Cancel button. If clicked the user will be redirected to the <returnurl> with the statuscode 108 which means CANCELLED.

After the interaction in the swish app is completed the customer will be redirected to the url in the element <returnurl> provided the page is not actively closed.

The SWISH payment method requires the <payeralias> element to be present in the payment request. The <payeralias> element contains the customer's cellular phone number in international format i.e. starting with country code followed by the cellular phone number, see below.

The <customerrefno> element is forwarded to the Swish payment system, to be used for reconciliation. The Swish payment system accepts only alphanumeric characters (A-Z,a-z, 0-9), and in case the customerrefno contains other characters, these will be removed before sent to the Swish payment system. The length supported is 34 characters.

In case the customer closes the web browser or clicks cancel on the page (as described above) the payment will be in a pending state. The merchant will not get the payment if the redirect flow is broken.

It is highly recommended to implement the callback when using Swish.

An example swish payment

Example XML-message

```
<?xml version="1.0" encoding="UTF-8"?>
<payment>
<paymentmethod>SWISH</paymentmethod>
<payeralias>46701234567</payeralias>
<currency>SEK</currency>
<amount>500</amount>
<vat>100</vat>
<customerrefno>unique_id</customerrefno>
<returnurl>https://webpaypaymentgatewaystage.svea.com/webpay-
admin/admin/merchantresponsetest.xhtml</returnurl>
</payment>
```

VIPPS PAYMENTS

The customer will be redirected to a page, Vipps landing-page, where the user is asked to open the VIPPS-app on the device where the app is installed and sign the payment.

On this page there is a Cancel button. If clicked the user will be redirected to the <returnurl> with the statuscode 108 which means CANCELLED.

After the interaction in the swish app is completed the customer will be redirected to the url in the element <returnurl> provided the page is not actively closed.

The VIPPS payment method will use a <payeralias> element if present in the payment request. The <payeralias> element contains the customer's cellular phone number, and it must have exactly eight digits. If the <payeralias> doesn't match the criteria statuscode 329 meaning BAD_MOBILE will be returned.

15 (57) Payment Gateway API V 2.9.2

If there is no <payeralias> the user will, still be redirected to Vipps landing-page where the user must type in the phone number.

The <customerrefno> element is forwarded to the VIPPS payment system, to be used for reconciliation. The VIPPS payment system accepts only alphanumeric characters and minus sign (a-z, 0-9, -), and in case the customerrefno contains other characters, these will be removed. The length supported is 50 characters.

The <message> element is displayed in the VIPPS application; it is not mandatory.

When integrating VIPPS the callback must be implemented.

An example VIPPS payment

Example XML-message

```
<?xml version="1.0" encoding="UTF-8"?>
<payment>
  <paymentmethod>VIPPS</paymentmethod>
  <payeralias>48060316</payeralias>
  <currency>NOK</currency>
  <amount>500</amount>
  <vat>100</vat>
  <customerrefno>1612427935683</customerrefno>
  <returnurl>https://webpaypaymentgatewaystage.svea.com/webpay-admin/admin/merchantresponsetest.xhtml</returnurl>
  <message>Buying a mobile</message>
</payment>
```

CARD PAYMENTS

The main way to make card payments is to use the payment method SVEACARDPAY. The customer will be sent to a webpage maintained by the card payment service provider, where the customer is asked to fill in their card number and details.

Pay with payment card.

Card number

Name

Expiry date /

CVV2/CVC2

Amount due: **5.00 SEK**

I want to pay
Cancel

If the SVEACARDPAY payment is approved, it will get the status AUTHORIZED. After midnight it will automatically be given the status CONFIRMED (unless the merchant is configured for manual confirm). After it is confirmed, it is automatically sent to the card payment service provider for capture. If this goes well, it will reach the final status SUCCESS, which means that the money has been transferred.

SVEACARDPAY supports the following currencies: SEK, DKK, EUR, GBP, NOK, PLN, USD, CHF.

The currency used must be supported by the acquiring agreement.

To choose language on the card payment page, the element <lang> can be used. Available language codes are: sv, da, de, en, fi, fr, no, pl.

Example XML-message:

```
<?xml version="1.0" encoding="UTF-8"?>
<payment>
  <paymentmethod>SVEACARDPAY</paymentmethod>
  <currency>SEK</currency>
  <amount>500</amount>
  <vat>100</vat>
  <customerrefno>unique_id</customerrefno>
  <returnurl>https://webpaypaymentgatewaystage.svea.com/webpay-admin/admin/merchantresponsetest.xhtml</returnurl>
  <lang>en</lang>
</payment>
```

CARD RESPONSE MESSAGE

For card payments, the <transaction> element of the response message contains some additional information:

<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
cardtype	Type of card	e.g. VISA	AN
maskedcardno	Truncated card no	e.g. 444433xxxxxx3300	AN(32)
authcode	Authorization number at EDB	Free text	AN(10)
expiryyear	Card expiry year	e.g. 13	N
expirymonth	Card expiry month	e.g. 04	N
storedcardalias	The alias for the stored card	GUID	AN(36)

<storedcardalias>

This element is returned in case the customer has chosen to store his card details.

RECURRING CARD PAYMENTS

Our card payment provider has the capability to store the card details of the customer so that money can be drawn from the card by the merchant at regular intervals. E.g. for a membership fee or for a subscription to a magazine or service.

First, the merchant has to be configured for recurring payments. To enable recurring payments for a particular customer, a subscription must be created. This is done by posting an initial transaction so that the customer can fill in their card number to be stored at the card payment page of the card payment provider. Later payments can be created by posting to the webservice recur. To set up a subscription, add the element <subscriptiontype> to the XML body of the initial transaction. It can have one of two values:

RECURRING RECURRINGCAPTURE

The merchant should use RECURRING if they only want to create a subscription, as a preparation for future payments, without immediately creating a payment. This is also called account verification, since it is a way to check if the customer's card is valid without drawing money from it. You should always set the initial amount to 0 since no money is to be transferred. A successful initial transaction will reach the "REGISTERED" status, and it will never be captured. To use RECURRING, the merchant must be set to allow account verification by someone at Svea. Here is an example of an initial transaction for a RECURRING subscription:

```
<?xml version="1.0" encoding="UTF-8"?>
<payment>
<currency>SEK</currency>
<amount>0</amount>
<customerrefno>unique_id</customerrefno>
<returnurl>https://webpaypaymentgatewaystage.svea.com/webpay-
admin/admin/merchantresponsetest.shtml</returnurl>
<paymentmethod>SVEACARDPAY</paymentmethod>
<subscriptiontype>RECURRING</subscriptiontype>
</payment>
```

The merchant should use RECURRINGCAPTURE if they also want to immediately create a new payment from the new subscription. I.e., two separate things will happen: a subscription will be created, and then a payment will be created from the subscription. The amount of the payment should be present in the request. If the initial payment is approved, it will reach the "AUTHORIZED" status, to

18 (57) Payment Gateway API V 2.9.2

be confirmed and captured later. Here is an example of an initial transaction for a RECURRING subscription:

```
<?xml version="1.0" encoding="UTF-8"?>
<payment>
<currency>SEK</currency>
<amount>500</amount>
<customerrefno>unique_id</customerrefno>
<returnurl>https://webpaypaymentgatewaystage.svea.com/webpay-
admin/admin/merchantresponsetest.xhtml</returnurl>
<paymentmethod>SVEACARDPAY</paymentmethod>
<subscriptiontype>RECURRINGCAPTURE</subscriptiontype>
</payment>
```

Regardless of the subscription type, if the initial transaction is successful, a subscription will be created. The corresponding subscriptionid is returned in the output XML body as <subscriptionid>. This ID is what the merchant should use when sending recur requests to our webservice. See the chapter about the webservice recur.

A successful recur operation that is made on the subscription will result in a normal SVEACARDPAY payment where the status is set to "AUTHORIZED", and it will be confirmed and captured later.

If no successful recur operation takes place, the subscription will become invalid after 12 months. Whenever a successful recur operation takes place, the subscription is extended to become valid for the coming 12 months.

AUTOMATIC RECUR

Card subscriptions created with the subscriptiontype RECURRING or RECURRINGCAPTURE can be configured to draw money from the card periodically, e.g. once a month. This is done manually on the subscription administration page. Open the subscription, tick the box, and fill in the rest of the information, including the amount that is to be drawn from the card every time. Automatic recur can be turned off again by unticking the box.

Administer subscription

Configure automatic debits
Activate automatic recur:
Interval between automatic debits: **MONTH** ▾
Date for next debit:
Amount to be debited:
VAT:

Merchants who expect so many customers that manual administration will be impractical may implement their own code for calculating when recurs are to be posted to our webservice.

PAYMENT FACILITATORS

A payment facilitator is a super merchant that can have sub merchants and can handle card payment acquirer agreements for those sub merchants, to simplify the integration. At the time being, only two payment facilitators are planned to be set up, internally in Svea.

To make payments through a payment facilitator, one first needs a specific agreement for this. The payment is made using the payment method SVEACARDPAY_PF, which is based on SVEACARDPAY, and the end customer will not notice any difference.

SVEACARDPAY_PF requires a number of customer data fields in the customer element. See Appendix 1 for all available customer data. To begin with, one must provide at least one of firstname, or lastname, or companyname. The other required fields are: ssn, address, city, zip, country, and industrycode. If the customer does not want to supply their personal information, you can instead use the optional field unknowncustomer and set it to true. If unknowncustomer is set to true, the only required customer field is country. unknowncustomer is only supposed to be used in exceptional cases.

STORED CARDS

When a card payment is made, it is possible to store the card data of the customer for future use. If the same customer makes a new payment, this data can be retrieved, so that the customer doesn't need to fill in their card number etc. the second time, thus speeding up the payment process and making it more convenient for the customer. This works for both SVEACARDPAY and SVEACARDPAY_PF.

The shop must first be configured for this in Payment Gateway. Contact Svea if you want this.

It must also be activated on the individual payment, and it can be controlled on a payment by payment basis. This is done by adding the following line in the payment request on the initial payment:

```
<showstorecarddialog>true</showstorecarddialog>
```

This is an optional element in the payment request. See the chapter THE HTTP PAYMENT REQUEST STRUCTURE.

When the showstorecarddialog has been set to true on a card payment, the card payment page will display an additional checkbox with a text asking the customer if they agree to storing their card details. It also says that the customer can contact Svea to cancel this consent. The card data of the customer will only be stored if the customer checks the checkbox.

If the customer checks the checkbox, the payment response message will contain an extra element called storedcardalias. For more info about this element, see the chapter CARD PAYMENTS, specifically the section called CARD RESPONSE MESSAGE.

The storedcardalias is an alias that represents the card number, and it can be used to make payments with the same card. If the same customer is about to make a new payment, the shop can choose to add this storedcardalias to the payment message. The new payment can then be completed without the need for the customer to enter the card number and data again. The storedcardalias element is described in the chapter THE HTTP PAYMENT REQUEST STRUCTURE.

If the alias is not used within a year, it will expire. Each time the alias is used, the expiry date is renewed, so that the alias can be used for a year from that point. If you want to check if the alias is still valid, you can use the webservice getstoredcard. See the chapter GETSTOREDCARD.

INVOICE PAYMENTS – DEPRECATED

NOTE this method is deprecated.

Invoice payments are possible to five countries, using the following payment methods:

SVEAINVOICEEU_SE - Sweden
 SVEAINVOICEEU_NO - Norway
 SVEAINVOICEEU_FI - Finland
 SVEAINVOICEEU_DE - Germany
 SVEAINVOICEEU_NL – Netherlands

Optional parameters			
Element name	Description	Value	Format
customer	Details about the customer. See Appendix 1		
iscompany	If the customer is a company. Defaults to false	e.g. true	Boolean
addinvoicfee	If Svea Ekonomi should add the configured invoice fee. Defaults to true	true/false	Boolean
addressid	AddressId from getAddress	Free text	AN

When calling one of these payment methods directly by specifying its name, e.g. SVEAINVOICEEU_SE, the tag <customer> is required. It may contain parameters that are used to identify the customer. Which customer parameters are required depends on the country. For Sweden, Norway, and Finland, only ssn is required. For Germany, the following are required: ssn (birth date), firstname, lastname, address, housenumber, zip, city. For Netherlands, the following are required: ssn (birth date), firstname, lastname, initials, address, housenumber, zip, city. For Germany and the Netherlands, it is recommended to fill in as much information as possible to make it easier to identify the customer, since those countries do not have social security numbers. If the customer is a company, set iscompany to true. The parameters companyname, companyid, and vatnumber are optional, except for DE and NL payments, where vatnumber is required.

When not specifying the payment method name, and thus allowing the customer to choose one of these payment methods on the pay page, the tag <customer> is not always required, but recommended. In this case, the ssn tag is not required for Sweden, Norway, or Finland. If ssn is not given as a parameter, the customer has to fill it in. It can be filled in with or without hyphen. There is also a radio button which allows the customer to choose if they are a private person or a company. If they are a company, they can fill in their organization number instead of a social security number.

22 (57) Payment Gateway API V 2.9.2

Example from the pay page, with the language set to English:

The country parameter in the customer element is not required, but recommended. If it is not included, it will be set automatically depending on the payment method. E.g. if the payment method is SVEAINVOICEEU_SE and no country is given, the country will be set to SE.

Example XML-message:

```
<?xml version="1.0" encoding="UTF-8"?>
<payment>
<paymentmethod>SVEAINVOICEEU_SE</paymentmethod>
<currency>SEK</currency>
<amount>500</amount>
<vat>100</vat>
<returnurl>https://webpaypaymentgatewaystage.svea.com/webpay-
admin/admin/merchantresponsetest.xhtml</returnurl>
<customerrefno>unique_id</customerrefno>
<customer>
  <ssn>460509-2222</ssn>
  <country>SE</country>
</customer>
<orderrows>
  <row>
    <name>ASUS P8P67 PRO Socket-1155</name>
    <amount>500</amount>
    <vat>100</vat>
    <quantity>1</quantity>
    <unit>st</unit>
    <sku>SK-54f-3S23-AB</sku>
    <description>ATX P67 DDR3 3xPCIe(2.0)x16 CFX SLI SATA 6Gb/s</description>
  </row>
</orderrows>
</payment>
```

For example payments, see Appendix 2.

23 (57) Payment Gateway API V 2.9.2

INVOICE RESPONSE MESSAGE

For invoice payments, the <transaction> element contains additional information:

<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
<customer>	Information about the customer		Complex type

The <customer> element in the response message holds the following information:

<customer>				
<i>Elementname</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>
legalname	Name of customer	e.g. Johan Testsson	AN(60)	
ssn	Social security number organization number	e.g. 460509-2222	AN(20)	
addressline1	Address	Free text	AN(40)	
addressline2	Address	Free text	AN(40)	
postcode	Zip code	e.g, 17233	AN(20)	
postarea	City	Free text	AN(25)	

PAYMENT PLANS – DEPRECATED

NOTE this method is deprecated.

To create a payment plan, use one of the following payment methods:

SVEASPLITEU_SE - Sweden
 SVEASPLITEU_NO - Norway
 SVEASPLITEU_FI - Finland

To call these payment methods directly, without redirecting the customer to the pay page, all of the elements <paymentmethod>, <customer>, and <campaigncode> are required.

The customer element may contain parameters that are used to identify the customer. Which parameters are required depends on the country. For Sweden, Norway, and Finland, only ssn is required.

Available campaign codes can be obtained via a web service method called GetPaymentPlanParamsEu described in a document called *Europe Web Service API*.

If the element <paymentmethod> is missing, the customer will be redirected to the pay page and has to choose a payment method. If ssn or campaigncode are also missing, the customer will have to fill in this information to use the payment plan payment method.

Example from the pay page:

The screenshot shows a dark blue header with the 'DELBETALA' logo. Below the header are four payment plan options in rounded rectangular buttons:

- Köp nu betala om 3 månader (räntefritt)** (green button, selected with a checkmark)
- Dela upp betalningen på 3 månader (räntefritt) (grey button, unselected)
- Dela upp betalningen på 12 månader (räntefritt) (grey button, unselected)
- Dela upp betalningen på 24 månader (grey button, unselected)

Below the buttons is a form field for 'Personnummer' (Personal Number) with the placeholder 'ÅÅMMDD-NNNN'. A red 'x' icon indicates an error or required field.

Note that some campaigns may require a certain currency, or that the amount is within a certain range, or may have other requirements. If these conditions are not fulfilled for any campaign, the payment plan alternative will not show up in the pay page. E.g. if the currency is SEK, only SVEASPLITEU_SE will show up in the list.

A payment plan cannot be created if the customer is a company.

Optional parameters			
Element name	Description	Value	Format
customer	Details about the customer		
addressid	AddressSelector from GetAddresses	Free text	AN
campaigncode	Used to choose a campaign	E.g. 213060	N

Example XML-message:

```
<?xml version="1.0" encoding="UTF-8"?>
<payment>
  <paymentmethod>SVEASPLITEU_SE</paymentmethod>
  <currency>SEK</currency>
  <returnurl>https://webpaypaymentgatewaystage.svea.com/webpay-admin/admin/merchantresponsetest.xhtml</returnurl>
  <amount>200000</amount>
  <vat>40000</vat>
  <customerrefno>unique_id</customerrefno>
  <customer>
    <ssn>460509-2222</ssn>
    <country>SE</country>
  </customer>
  <campaigncode>213060</campaigncode>
  <orderrows>
    <row>
      <name>ASUS P8P67 PRO Socket-1155</name>
      <amount>200000</amount>
      <description>ATX P67 DDR3 3xPCIe(2.0)x16 CFX SLI SATA 6Gb/s</description>
      <vat>40000</vat>
      <quantity>1</quantity>
      <sku>SK-54f-3S23-AB</sku>
      <unit>st</unit>
    </row>
  </orderrows>
</payment>
```

PAYMENT PLAN RESPONSE MESSAGE

For payment plans, the <transaction> element contains extra information:

Element name	Description	Value	Format
<sveapaymentplannr>	The payment plan number at Svea		AN(256)
<customer>	Information about consumer		Complex type

The <customer> element in the response message holds the following information:

<customer>				
Elementname	Description	Value	Format	Mandatory
legalname	Name of customer	e.g. Johan Testsson	AN(60)	
ssn	Social security number organization number	e.g. 460509-2222	AN(20)	
addressline1	Address	Free text	AN(40)	
addressline2	Address	Free text	AN(40)	
postcode	Postal code	e.g, 17233	N	
postarea	City	Free text	AN(25)	

26 (57) Payment Gateway API V 2.9.2

PAYPAL PAYMENTS

Before using PAYPAL the merchants paypal ClientId and ClientSecret must be sent to SveaEkonomi, and the merchant configuration must be updated accordingly.

WEBSERVICES

Send a request consisting of the following parameters:

HTTP POST	
Parameter name	Description
message	Base64 encoded XML message
merchantid	Merchant ID
mac	Checksum

- merchantid - is the store ID that you received from your integrator.
- message - contains the Base64 encoded XML you have generated as described in the section the query request structure.
- mac - includes the control numbers that have been developed in order to verify the sender of the call. In order to generate this you must have received a secret word from your integrator. See more under section MAC.

THE WEBSERVICE REQUEST

A request contains the three parameters: message, merchantid and mac. The message has to be Base64 encoded.

Example of a POST:

```
<form action="https://webpaypaymentgatewaystage.svea.com/webpay/rest/payment" method="post">
<input type="hidden" name="mac" value="dd57e26612b586a1d55efb91b3bc21902e3ae09499bf074d0c0624820fcdc61b243f24b4f3c9b1feac06ffd3cfe14fb8165a7c83d9fcd550196f7e7fb20e43c2" />
<input type="hidden" name="merchantid" value="1109" />
<input type="hidden" name="message" value="PD94bWwgdMvYc2lvcj0iMS4wIiBlbmNvZGluc2Z0iVVRGLTgiPz4NCjxjYXB0dXJlPg0KPHRyYW5zYWw0aW9uawQ+NTIxNjc3PC90cmFuc2FjdGlvbm1kPg0KPC9jYXB0dXJlPg==" />
<input type="submit" value="payment" />
</form>
```

THE WEBSERVICE RESPONSE

The response contains the three parameters: message, merchantid and mac. The message is Base64 encoded. The contents of the message is different for different webservises.

Example of response:

```
<?xml version="1.0" encoding="UTF-8"?><response><message>PD94bWwgdMvYc2lvcj0iMS4wIiBlbmNvZGluc2Z0iVVRGLTgiPz48cmVzcG9uc2U+PHRyYW5zYWw0aW9uawQ+NTIxNjc3PC90cmFuc2FjdGlvbj48c3RhdHVzY29kZT4wPC9zdGF0dXNjb2RlPjwvcmlvZG9uc2U+</message>
<merchantid>1109</merchantid>
<mac>70d118d8ff816fbc7244305ada2f335719dc5a680c91f00b88679b348f007ab5cec746d4fd7002e3bfc8ba72c0f524fe28f2a9bd9efbc392fea8a8386625ae4</mac>
</response>
```

ANNUL

The annul request can be used to cancel a payment before it has been captured. It can only be performed on card, invoice, or payment plan transactions having the status AUTHORIZED or CONFIRMED.

URL to POST for test requests:

<https://webpaypaymentgatewaystage.svea.com/webpay/rest/annul>

URL to POST for production requests:

<https://webpaypaymentgateway.svea.com/webpay/rest/annul>

THE ANNUL REQUEST STRUCTURE

The call is structured in XML with the root element <annul>. It contains the transaction id of the transaction to annul.

<annul>				
<i>Element name</i>	<i>Content</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>
transactionid	Transaction ID		N	Y

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<annul>
<transactionid>521677</transactionid>
</annul>
```

THE ANNUL RESPONSE

The response is Base64 encoded. See the chapter WEBSERVICES for an example.

The Base64 decoded message contains a <response> tag.

<response>				
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>	
transaction	Transaction ID	Complex type	Complex type	
statuscode	Status of the webservice request	See Appendix 1	N	

The <transaction> element contains an attribute id representing the Transaction ID. The element contains the following information.

<transaction>				
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>	
customerrefno	Order ID	Free text	AN(64)	

CANCELRECURSUBSCRIPTION

This request inactivates an existing recur subscription so that no more recurs can be made on it.

URL to POST for test requests:

<https://webpaypaymentgatewaystage.svea.com/webpay/rest/cancelrecursubscription>

URL to POST for production requests:

<https://webpaypaymentgateway.svea.com/webpay/rest/cancelrecursubscription>

THE REQUEST STRUCTURE

The call is structured in XML with a root element <cancelrecursubscription>. This element contains the subscription ID (not transaction ID) of the subscription you want to inactivate.

<cancelrecursubscription>				
<i>Element name</i>	<i>Content</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>
subscriptionid	Subscription ID		N	Y

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<cancelrecursubscription>
<subscriptionid>1234</subscriptionid>
</cancelrecursubscription>
```

THE CANCELRECURSUBSCRIPTION RESPONSE

The response is Base64 encoded. See the chapter WEBSERVICES for an example.

The Base64 decoded message contains a <response> tag.

<response>				
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>	
statuscode	Status of the webservice request	See Appendix 1	N	

CONFIRM

The confirm request is intended for card transactions. It can only be performed on card transactions having the status AUTHORIZED. This will result in a CONFIRMED transaction that will be captured (settled) on the given capture date. Confirm is mainly used by merchants who are configured to confirm their transactions themselves. Otherwise the transactions are confirmed automatically.

URL to POST for test requests:

<https://webpaypaymentgatewaystage.svea.com/webpay/rest/confirm>

URL to POST for production requests:

<https://webpaypaymentgateway.svea.com/webpay/rest/confirm>

THE CONFIRM REQUEST STRUCTURE

The call is structured in XML with the root element <confirm>. The <confirm> element contains the transaction ID of the transaction to confirm, as well as the capture date. The capture date tells when to capture the transaction. The date format used is the ISO-8601 extended date format, a.k.a. E8601DAw ("yyyy-MM-dd").

<confirm>				
Element name	Content	Value	Format	Mandatory
transactionid	Transaction ID		N	Y
capturedate	Capture date		D	Y

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<confirm>
<transactionid>521527</transactionid>
<capturedate>2011-09-21</capturedate>
</confirm>
```

THE CONFIRM RESPONSE

The response is Base64 encoded. See the chapter WEBSERVICES for an example.

The Base64 decoded message contains a <response> tag.

<response>			
Element name	Description	Value	Format
transaction	Transaction ID	Complex type	Complex type
statuscode	Status of the webservice request	See Appendix 1	N

The <transaction> element contains an attribute id representing the Transaction ID. The element also contains the following information.

<transaction>			
Element name	Description	Value	Format
customerrefno	Order ID	Free text	AN(64)

CREDIT

The credit request can be used to return money to the customer. Only transactions that have reached the status SUCCESS can be credited.

URL to POST for test requests:

<https://webpaypaymentgatewaystage.svea.com/webpay/rest/credit>

URL to POST for production requests:

<https://webpaypaymentgateway.svea.com/webpay/rest/credit>

THE CREDIT REQUEST STRUCTURE

The call is structured in XML with the root element <credit>. The <credit> element should contain the transaction ID and the amount to credit.

<credit>				
<i>Element name</i>	<i>Content</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>
transactionid	Transaction ID		N	Y
amounttocredit	The amount that you want to credit in minor currency	E.g. 1001	N	Y

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<credit>
<transactionid>521527</transactionid>
<amounttocredit>100</amounttocredit>
</credit>
```

THE CREDIT RESPONSE

The response is Base64 encoded. See the chapter WEBSERVICES for an example.

The Base64 decoded message contains a <response> tag.

<response>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
transaction	Transaction ID	Complex type	Complex type
statuscode	Status of the webservice request	See Appendix 1	N

The <transaction> element contains an attribute id representing the Transaction ID. The element contains the following information.

<transaction>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
customerrefno	Order ID	Free text	AN(64)

GETPAYMENTMETHODS

This request is used to fetch a list of the payment methods available for the merchant.

URL to POST for test requests:

<https://webpaypaymentgatewaystage.svea.com/webpay/rest/getpaymentmethods>

URL to POST for production requests:

<https://webpaypaymentgateway.svea.com/webpay/rest/getpaymentmethods>

THE GETPAYMENTMETHODS REQUEST STRUCTURE

The call is structured in XML and you need a root element <getpaymentmethods>.

<getpaymentmethods>				
<i>Element name</i>	<i>Content</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<getpaymentmethods></getpaymentmethods>
```

THE GETPAYMENTMETHODS RESPONSE

The response is Base64 encoded. See the chapter WEBSERVICES for an example.

The Base64 decoded message contains a <response> tag.

<response>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
paymentmethods	Containing an array of paymentmethod elements		array
statuscode	Status of the webservice request	See Appendix 1	N

The <paymentmethods> element contains the following information.

<paymentmethods>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
paymentmethod	Payment method name	See Appendix 1	enum

GETRECONCILIATIONREPORT

The getreconciliationreport request will return a list of the transactions that were captured or credited at a specified date or during a date span.

URL to POST for test requests:

<https://webpaypaymentgatewaystage.svea.com/webpay/rest/getreconciliationreport>

URL to POST for production requests:

<https://webpaypaymentgateway.svea.com/webpay/rest/getreconciliationreport>

THE GETRECONCILIATIONREPORT REQUEST STRUCTURE

The call is structured in XML with the root element <getreconciliationreport>.

<getreconciliationreport>				
<i>Element name</i>	<i>Content</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>
date	Date	Ex: 2011-11-07	AN	Y

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<getreconciliationreport>
<date>2011-11-07</date>
</getreconciliationreport>
```

If a span of dates are desired the structure will be:

<getreconciliationreport>				
<i>Element name</i>	<i>Content</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>
fromdate	Date	Ex: 2014-11-01	AN	Y
todate	Date	Ex: 2014-11-30	AN	Y

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<getreconciliationreport>
<fromdate>2014-11-01</fromdate>
<todate>2014-11-30</todate>
</getreconciliationreport>
```

THE GETRECONCILIATIONREPORT RESPONSE

The response is Base64 encoded. See the chapter WEBSERVICES for an example.

The Base64 decoded message contains a <response> tag.

<response>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
reconciliation	An array of reconciliationtransaction types	Complex type array	Complex type array
statuscode	Status of the webservice request	See Appendix 1	N

Content of the <reconciliation> tag

<reconciliation>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
reconciliationtransaction	Information about a reconciliationtransaction	Complex type	Complex type

34 (57) Payment Gateway API V 2.9.2

Content of the <reconciliationtransaction> tag

<reconciliationtransaction>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
transactionid	Transaction ID		N
customerrefno	Merchant's referense		AN
paymentmethod	Payment method	See Appendix 1	AN(32)
amount	Amount in minor currency. + or -	Eg 1900 or - 1900	N
time	Time of the transaction	yyyy-MM-dd HH:mm:ss z	AN

GETSTOREDCARD

This request can be used to check if the alias of a stored card is valid. The alias can only be used to create payments if it is valid. If the alias is not used within a year, it will expire. Each time the alias is used, the expiry date is renewed, so that the alias can be used for a year from that point.

Please only use this web service if needed. Repetitive polling is not allowed.

URL to POST for test requests:

<https://webpaypaymentgatewaystage.svea.com/webpay/rest/getstoredcard>

URL to POST for production requests:

<https://webpaypaymentgateway.svea.com/webpay/rest/getstoredcard>

THE GETSTOREDCARD REQUEST STRUCTURE

The call is structured in XML with the root element <getstoredcard>.

<getstoredcard>				
<i>Element name</i>	<i>Content</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>
storedcardalias	The alias for the stored card	GUID	AN(36)	Y

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<getstoredcard>
  <storedcardalias>21ff4c0e-b398-42c3-9a60-f971dde92b95</storedcardalias>
</getstoredcard>
```

THE GETSTOREDCARD RESPONSE

The response is Base64 encoded. See the chapter WEBSERVICES for an example.

The Base64 decoded message contains a <response> tag.

<response>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
statuscode	Status of the request	See Appendix 1	N
cardvalid	Tells if the stored card alias is valid	true or false	Boolean

LOWERAMOUNT

The loweramount operation is intended for card transactions having the status AUTHORIZED or CONFIRMED. It can be used e.g. if the merchant is unable to deliver all of the items that was ordered by the customer, and wants to lower the total amount to pay. If the <amounttolower> is equal to the authorized amount, the transaction status will change to annulled.

URL to POST for test requests:

<https://webpaypaymentgatewaystage.svea.com/webpay/rest/loweramount>

URL to POST for production requests:

<https://webpaypaymentgateway.svea.com/webpay/rest/loweramount>

THE LOWERAMOUNT REQUEST STRUCTURE

The call is structured in XML with the root element <loweramount>. The <loweramount> element contains the transaction id of the transaction you want to annul.

<loweramount>				
<i>Element name</i>	<i>Content</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>
transactionid	Transaction ID		N	Y
amounttolower	The amount you wish to lower the transaction by.		N	Y

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<loweramount>
<transactionid>521677</transactionid>
<amounttolower>2000</amounttolower>
</loweramount>
```

THE LOWERAMOUNT RESPONSE

The response is Base64 encoded. See the chapter WEBSERVICES for an example.

The Base64 decoded message contains a <response> tag.

<response>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
transaction	Transaction ID	Complex type	Complex type
statuscode	Status of the webservice request	See Appendix 1	N

The <transaction> element contains an attribute id representing the Transaction ID. The element also contains the following information.

<transaction>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
customerrefno	Order ID	Free text	AN(64)

PREPAREPAYMENT

The preparepayment request can be used to let Svea Ekonomi do the necessary pre-processing of a payment in advance. This allows the merchant to send the customer to the payment gateway through a HTTP GET instead of a HTTP POST. To complete the payment, the customer visits a certain URL containing the ID of the prepared payment. The customer can either be redirected to this URL by the merchant, or the merchant can give it to the customer, e.g. in an email, so that they can visit it themselves. A prepared payment is valid up to one hour after creation.

Preparepayment is not the standard method for creating payments, and should only be used when there is a specific reason to use it.

URL to POST for test requests:

<https://webpaypaymentgatewaystage.svea.com/webpay/rest/preparepayment>

URL to POST for production requests:

<https://webpaypaymentgateway.svea.com/webpay/rest/preparepayment>

THE PAYMENT REQUEST STRUCTURE

The request is structured in XML and you need a root element <payment>. The <payment> element contains information needed to create a new payment.

Information needed is the same as in a request to our payment gateway except two additional required parameters.

Additional parameters				
<i>Element name</i>	<i>Content</i>	<i>Value</i>	<i>Format</i>	<i>Mandatory</i>
lang	Language according to ISO 639-1	Ex: sv	AN	Y
laddress	Customer's IP address		AN	Y

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<payment>

THE PREPAREPAYMENT RESPONSE

The response is Base64 encoded. See the chapter WEBSERVICES for an example.

<response>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
preparedpayment	Information about your prepared payment	Complex type	Complex type
statuscode	Status of the webservice request	See Appendix 1	N

Content of the <preparedpayment> tag

<preparedpayment>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
id	Prepared payment id	e.g 7	N
created	Date when the object was created	e.g. 2011-09-27 16:55:01.21	AN

When redirecting the customer to let them complete their payment, the prepared payment ID should be appended to the URL.

Example URL for a test redirect:

<https://webpaypaymentgatewaystage.svea.com/webpay/preparedpayment/123456>

Example URL for a production redirect:

<https://webpaypaymentgateway.svea.com/webpay/preparedpayment/123456>

QUERY

Query is used to get information about a specific transaction. To do this one must know either the transactionid set by Svea Ekonomi, or the customerrefno that has been set by the merchant. These have different URL: s.

Please only use this web service when needed. Repetitive polling is not allowed.

URL to POST for test requests:

<https://webpaypaymentgatewaystage.svea.com/webpay/rest/querytransactionid>
<https://webpaypaymentgatewaystage.svea.com/webpay/rest/querycustomerrefno>

URL to POST for production requests:

<https://webpaypaymentgateway.svea.com/webpay/rest/querytransactionid>
<https://webpaypaymentgateway.svea.com/webpay/rest/querycustomerrefno>

THE QUERY REQUEST STRUCTURE

The call is structured in XML and you need a root element <query>. The <query> element contains either the orderid or transaction ID that you want to query.

Query based on the order ID:

<query>				
Element name	Content	Value	Format	Mandatory
customerrefno	Order ID		AN(32)	Y

Example:

```
<?xml version="1.0" encoding="UTF-8"?>
<query>
<customerrefno>temping1238u96896</customerrefno>
</query>
```

Query based on the transaction ID

<query>				
Element name	Content	Value	Format	Mandatory
transactionid	Transaction ID		N	Y

Example:

```
<?xml version="1.0" encoding="UTF-8"?>
<query>
<transactionid>521527</transactionid>
</query>
```

THE QUERY RESPONSE

The response is Base64 encoded. See the chapter WEBSERVICES for an example.

The Base64 decoded message contains a <response> tag.

<response>			
Element name	Description	Value	Format
transaction	Transaction ID	Complex type	Complex type
statuscode	Status of the webservice request	See Appendix 1 1	N

The <transaction> element contains an attribute id representing the Transaction ID. The element also contains the following information.

<transaction>			
<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
<customerrefno>	Order id	Free text	AN(64)
<merchantid>	Merchant id		N
<status>	Latest transaction status.	e.g SUCCESS	AN(32)
<amount>	Total amount in minor currency, including VAT	e.g 1000	N
<currency>	Currency	ISO 4217 alphabetic (e.g. SEK)	AN(3)
<vat>	VAT in minor currency	e.g. 1000	N
<capturedamount>	Captured amount	e.g. 1000	N
<authorizedamount>	Authorized amount	e.g. 1000	N
<created>	Timestamp when transaction was created	e.g. 2011-09-27 16:55:01.21	
<creditstatus>	Status of the last credit attempt		AN(32)
<creditedamount>	Total amount that has been credited	e.g. 1000	N
<merchantresponsecode>	Last statuscode response returned to merchant. See Appendix 1		N
<paymentmethod>	Paymentmethod. See Appendix 1		AN(32)
<orderrows>	Element containing <row> elements.		Complex type
<capturedate>	When the transaction was captured	e.g. 2011-09-27 16:55:01.21	

41 (57) Payment Gateway API V 2.9.2

If you are querying a card payment you will get more information within the <transaction> element.

<i>Element name</i>	<i>Description</i>	<i>Value</i>	<i>Format</i>
<cardtype>	Brand of the card	e.g. VISA or MASTERCARD	AN(64)
<eci>	Enrollement status from MPI. If the card is 3Dsecure enabled or not.		N
<mdstatus>	Value calculated from eci as requested by acquiring bank		N
<expiryyear>	Expire year of the card		AN(4)
<expirymonth>	Expire month of the card		AN(2)
<chname>	Cardholder name as entered by cardholder		AN(100)
<authcode>	EDB authorization code		AN(10)

RECUR

The recur request creates a new transaction from a subscription. (As we have seen, a subscription is created by making a transaction that has a subscriptiontype.)

URL to POST for test requests:

<https://webpaypaymentgatewaystage.svea.com/webpay/rest/recur>

URL to POST for production requests:

<https://webpaypaymentgateway.svea.com/webpay/rest/recur>

THE RECUR REQUEST STRUCTURE

The request XML should have the root element <recur>. The <recur> element may contain the following elements.

<recur>				
Element name	Content	Value	Format	Mandatory
customerrefno	The new unique customerrefno	E.g. 10003	AN	Y
subscriptionid	The subscription id	E.g. 1005	N	Y
currency	Currency	E.g. SEK	AN	N
amount	The amount to recur in minor currency	E.g. 1001	N	Y
vat	VAT amount	E.g. 250	N	N

If the subscription type is RECURRING or RECURRINGCAPTURE, the currency for the recur request must be the same as the currency in the initial transaction. To avoid errors, the currency parameter can be omitted.

The amount on the recur request does not need to be the same as the amount on the initial transaction that created the subscription. It can be smaller or larger. VAT is not needed on the recur request.

Example of XML structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<recur>
<customerrefno>10003</customerrefno>
<subscriptionid>2003</subscriptionid>
<currency>SEK</currency>
<amount>600</amount>
</recur>
```

THE RECUR RESPONSE

The response is Base64 encoded. See the chapter WEBSERVICES for an example.

The Base64 decoded message contains a <response> tag.

<response>			
Element name	Description	Value	Format
transaction	Transaction details	Complex type	Complex type
statuscode	Status of the webservice request	See Appendix 1	N

The <transaction> element contains an information regarding the transaction that was created as a result of the recur operation. The element contains a transaction id as attribute as well as the following information.

<transaction>		
<i>Element name</i>	<i>Description</i>	<i>Format</i>
customerrefno	Order ID	AN(64)
paymentmethod	Payment method	AN
merchantid	Merchant id	N
amount	Total amount in minor currency	N
currency	Currency	N
cardtype	Card type	AN
maskedcardno	Masked card number	N
expirymonth	Expiry month	N(2)
expiryyear	Expiry year	N(2)
authcode	Authorization code	N
subscriptionid	Subscription id	N

MAC

In this context, MAC stands for Message Authentication Key. In order to verify a request, the merchant needs to create a MAC-string for each request (payment or webservice).

The MAC is calculated by taking the Base64 encoded XML string and appending the "secret word". Hash the resulting string by using SHA-512.

FORMULA

MAC = SHA512Hash(Base64Encoded(xmlMessage) + secretWord);

Step1

<p>Example of XML-message:</p> <pre><?xml version="1.0" encoding="UTF-8"?> <payment> <paymentmethod>DBNORDEASE</paymentmethod><currency>SEK</currency> <returnurl>https://webpaypaymentgatewaystage.svea.com/webpay-admin/admin/merchantresponsetest.xhtml</returnurl> <amount>50001</amount><customerrefno>testingnrglkhohjf</customerrefno> </payment></pre>

Step 2

<p>Example of Base64 encoded XML-message</p> <pre>PD94bWwgdMvYc2lvbj0iMS4wliBlbmNvZGluZz0iVVRGLTgiPz4gPHBheW1lbnQ+IDxwYXltZW50bWV0aG9kPkRCTk9SREVBU0U8L3BheW1lbnRtZXRob2Q+PGN1cnJlbnN5PINFSzwvY3VycmVuY3k+IDxyZXR1cm51cmw+aHR0cHM6Ly90ZXN0LnN2ZWFla29ub21pLnNIL3diYnBheS1hZG1pbi9hZG1pbi9tZXJjaGFudHJlc3BvbWVzZC54aHRtbDwvcmV0dXJudXJsPiA8YW1vdW50PjUwMDAxPC9hbW91bnQ+PGN1c3RvbWVycmVmbm8+dGVzdGluZ25yZ2xramhob2hqZjwvY3VzdG9tZXJyZWZubz4gPC9wYXltZW50Pg==</pre>

Step 3

<p>Example of 'secret word' received from your integrator:</p> <pre>df74ce933f1d367d4100b4d34ad6970760c6040e13d49b94b36bd81239c2c3a724435ab5dc4e1065c861944f9a1e56fa1f53f1cd22d71564e69d5256fba24d43</pre>

Step 4

<p>Example of generated MAC value:</p> <pre>6ebd5713546951f69f405b65768d3ce4aa9bd7dc77ecb7c9928ed64073cc0d384d8f6cf4eb5c199b5ba957fb2dcc0cb93c7eaf76759a7688726ca4a6216d4ff5</pre>

APPENDIX 1

PAYMENT METHODS

Payment method	Description
DBAKTIAFI	Bank payments, Aktia, Finland
DBALANDSBANKENFI	Bank payments, Alandsbanken, Finland
DBDANSKEBANKSE	Bank payments, Danske Bank, Sweden
DBNORDEAFI	Bank payments, Nordea, Finland
DBNORDEASE	Bank payments, Nordea, Sweden
DBPOHJOLAFI	Bank payments, OP-Pohjola, Finland
DBSAMPOFI	Bank payments, Sampo (Danske Bank), Finland
DBSEBSE	Bank payments, private, SEB, Sweden
DBSEBFTGSE	Bank payments, corporate, SEB, Sweden
DBSHBFI	Bank payments, Handelsbanken, Finland
DBSHBSE	Bank payments, Handelsbanken, Sweden
DBSPANKKIFI	Bank payments, S-Pankki, Finland
DBSWEDBANKSE	Bank payments, Swedbank, Sweden
DBTAIOLAFI	Bank payments, Tapiola, Finland
PAYPAL	PayPal
SVEAINVOICEEU_NO	Invoice payments, Svea Ekonomi, Norway
SVEAINVOICEEU_SE	Invoice payments, Svea Ekonomi, Sweden
SVEASPLITEU_NO	Payment plans, Svea Ekonomi, Norway
SVEASPLITEU_SE	Payment plans, Svea Ekonomi, Sweden
SVEACARDPAY	Card payments, Svea Ekonomi
SVEACARDPAY_PF	SVEACARDPAY via a payment facilitator
SWISH	Bank payments, Sweden
VIPPS	Card payments, Norway

INDEPENDENT WEBSERVICES

These webservices are not tied to any particular payment method:

getpaymentmethods
getreconciliationreport
preparepayment

THE CUSTOMER ELEMENT

For any payment method, the shop may add a customer element to the payment message. For some payment methods this is required, e.g. for invoices, payment plans and PayPal. In most cases it is unnecessary, e.g. for card and direct bank payments.

The customer element may contain the following parameters:

<customer>				
Element name	Description	Value	Format	Mandatory
ssn	Social security number or organization number	e.g. 123456-7890	AN(13)	
firstname	First name of customer	Free text	AN(128)	
lastname	Last name of customer	Free text	AN(128)	
initials	Initials of customer	Free text	AN(32)	
address	Address	Free text	AN(256)	
address2	c/o	Free text	AN(256)	
housetnumber	House number	Free text	AN(32)	
zip	Postal code	e.g. 12345	N	
city	City	Free text	AN(45)	
country	Country code	e.g. SE	AN(45)	
phone	Phone number	e.g. 555-123456	AN(45)	
email	Email	Free text	AN(256)	
companyname	Use if customer is company	Free text	AN(128)	
companyid	Id of the company		N	
vatnumber	Vat number of the company	e.g. DE123456789	AN(32)	
industrycode	Activity classification. For government use 99998, private person use 99999.	e.g. 47523	N	
iscompany	If the customer is a company. Defaults to false	e.g. true	Boolean	
unknowncustomer	Used mostly on payment facilitator payments	e.g. true	Boolean	

TRANSACTION STATUS

Below are all possible states that a transaction can be in. During the lifetime of a transaction, the status may change many times, most often ending up as either SUCCESS or FAILED.

The status can be obtained in several different ways, e.g. by looking in the Transaction Details window, or by making a request to the query webservice. The range of possible statuses for a specific transaction depends on its payment method.

Status
NEW
RECEIVED
INVALID
VALID
PENDING
PENDINGRECUR
RESPONSE_RECEIVED
FAILED
CANCELLED
REGISTERED
AUTHORIZED
CONFIRMED
ANNULLED
CAPTENDING
CAPTFAILED
SUCCESS
ERROR

STATUS CODES

Status codes are also used in the response message to webservice calls, to convey the result. A webservice call that was successful will have the statuscode SUCCESS in the response message. If the call failed, another status code will be given to act as an error code.

Another way to view status codes is to see them as extra information that clarifies the status of a transaction. All but one of them are error codes and those will most often be seen together with the status FAILED, to explain what went wrong. A transaction with the status SUCCESS will most often have the status code SUCCESS.

Code	Name	Description
0	SUCCESS	Request performed successfully
1	REQUIRES_MANUAL_REVIEW	Request performed successfully but requires manual review by merchant
100	INTERNAL_ERROR	Internal system error
101	XMLPARSEFAIL	Invalid XML
102	ILLEGAL_ENCODING	Invalid encoding
104	ILLEGAL_URL	Invalid URL
105	ILLEGAL_TRANSACTIONSTATUS	Invalid transaction status
106	EXTERNAL_ERROR	Failure at third party e.g. the bank
107	DENIED_BY_BANK	Transaction rejected by bank
108	CANCELLED	Transaction cancelled
110	ILLEGAL_TRANSACTIONID	Invalid transaction ID
111	MERCHANT_NOT_CONFIGURED	Merchant not configured
112	MERCHANT_NOT_CONFIGURED_AT_BANK	Merchant not configured at bank

113	PAYMENTMETHOD_NOT_CONFIGURED	Payment method not configured for merchant
114	TIMEOUT_AT_BANK	Timeout at bank
115	MERCHANT_NOT_ACTIVE	The merchant is inactivated
116	PAYMENTMETHOD_NOT_ACTIVE	The payment method is inactivated
117	ILLEGAL_AUTHORIZED_AMOUNT	Amount cannot be authorized
118	ILLEGAL_CAPTURED_AMOUNT	Amount cannot be captured
119	ILLEGAL_CREDITED_AMOUNT	Amount cannot be credited
124	EXCEEDS_AMOUNT_LIMIT	Amount exceeds the limit
126	TRANSACTION_NOT_BELONGING_TO_MERCHANT	Transaction does not belong to merchant
127	CUSTOMERREFNO_ALREADY_USED	Customer reference number already used in another transaction
128	NO_SUCH_TRANS	Transaction does not exist
129	DUPLICATE_TRANSACTION	More than one transaction found for the given customerrefno
130	ILLEGAL_OPERATION	Operation not allowed for the given payment method
131	COMPANY_NOT_ACTIVE	Company inactivated
133	SUBSCRIPTION_NOT_ACTIVE	Subscription not active
134	SUBSCRIPTION_NOT_SUPPORTED	Payment method doesn't support subscriptions
135	ILLEGAL_DATE_FORMAT	Invalid date format
136	ILLEGAL_RESPONSE_DATA	Invalid response data
138	CURRENCY_NOT_CONFIGURED	Currency not configured
139	CURRENCY_NOT_ACTIVE	Currency not active
140	CURRENCY_ALREADY_CONFIGURED	Currency is already configured
142	NO_VALID_PAYMENT_METHODS	No valid payment methods
143	CREDIT_DENIED_BY_BANK	Credit denied by bank
144	ILLEGAL_CREDIT_USER	User is not allowed to perform credit operation
146	CUSTOMER_NOT_FOUND	Customer not found
147	AGE_LIMIT_EXCEEDED	E.g. the transaction is too old
148	BROWSER_NOT_SUPPORTED	The browser version is too old
149	PENDING	The request is still being processed
150	CREDIT_PENDING	The credit could not be handled instantly. It is put in a queue it will be processed in due time.
301	BAD_TRANSACTION_ID	Invalid transaction ID
303	BAD_MERCHANT_ID	Invalid merchant ID
304	BAD_LANG	Invalid language
305	BAD_AMOUNT	Invalid amount
306	BAD_CUSTOMERREFNO	Invalid customerrefno
307	BAD_CURRENCY	Invalid currency
308	BAD_PAYMENTMETHOD	Invalid payment method
309	BAD_RETURNURL	Invalid returnurl
311	BAD_MAC	Invalid mac
316	BAD_CARDNUMBER_OR_CARDTYPE_NOT_CONFIGURED	Card type not configured for merchant
317	BAD_SSN	Invalid ssn
318	BAD_VAT	Invalid vat
319	BAD_CAPTURE_DATE	Invalid capture date
320	BAD_CAMPAIGN_CODE	Invalid campaign code

321	BAD_SUBSCRIPTION_TYPE	Invalid subscription type
322	BAD_SUBSCRIPTION_ID	Invalid subscription ID
323	BAD_BASE64	Invalid Base64
325	BAD_CALLBACKURL	Invalid callbackurl
326	THREE_D_CHECK_FAILED	3D check failed
327	CARD_NOT_ENROLLED	Card not enrolled in 3D Secure
328	BAD_IPADDRESS	Provided IP address is invalid
329	BAD_MOBILE	Invalid mobile phone number
330	BAD_COUNTRY	Invalid country
331	THREE_D_CHECK_NOT_AVAILABLE	Merchant 3D configuration invalid
332	TIMEOUT	Timeout at Svea
333	BAD_PERIOD	The reconciliation period is invalid
334	BAD_ADDRESS_ID	AddressSelector is not valid for this CountryCode
335	BAD_CUSTOMER_DATA	The supplied customer data is invalid
336	BAD_UNIT	Invalid unit
337	BAD_EXTERNAL_PAYMENT_REF	Invalid external payment reference
338	BAD_STOREDCARDALIAS	Invalid stored card alias
339	STOREDCARDALIAS_NOT_ACTIVE	Stored card alias inactive
340	STORED_CARDS_NOT_ENABLED	
341	ONLY_DEBIT_CARDS_ALLOWED	
342	TRANSACTION_ALREADY_IN_PROGRESS	
343	BAD_CANCELURL	Invalid Cancel url
344	BAD_SIMULATOR_CODE	Invalid value for Simulator Code
345	BAD_ORDER_ROW	Invalid format for Order Row
346	BAD_PAYER_ALIAS	Invalid format for Payer Alias-Phone number
347	BAD_SHOW_STORE_CARD_DIALOG	Invalid value for Show Store Card Dialog
500	ANTIFRAUD_CARDBIN_NOT_ALLOWED	Antifraud - cardbin not allowed
501	ANTIFRAUD_IPLOCATION_NOT_ALLOWED	Antifraud – iplocation not allowed
502	ANTIFRAUD_IPLOCATION_AND_BIN_DOESNT_MATCH	Antifraud – ip-location and bin does not match
503	ANTIFRAUD_MAX_AMOUNT_PER_IP_EXCEEDED	Antofraud – max amount per ip exceeded
504	ANTIFRAUD_MAX_TRANSACTIONS_PER_IP_EXCEEDED	Antifraud – max transactions per ip exceeded
505	ANTIFRAUD_MAX_TRANSACTIONS_PER_CARDNO_EXCEEDED	Antifraud – max transactions per card number exceeded
506	ANTIFRAUD_MAX_AMOUNT_PER_CARDNO_EXCEEDED	Antifraud – max amount per cardnumber exceeded
507	ANTIFRAUD_IP_ADDRESS_BLOCKED	Antifraud – IP address blocked.
600	SWISH_NOT_ENROLLED	Payer alias is invalid, or payee not enrolled
601	SWISH_REFUND_ORDER_NOT_FOUND	Original Payment not found or original payment is more than 13 months old
602	SWISH_REFUND_PAYER_ERROR	Payer alias in the refund does not match the payee alias in the original payment

603	SWISH_REFUND_PAYER_ORGNR_ERROR	Payer organization number do not match original payment payee organization number
604	SWISH_REFUND_PAYEE_SSN_ERROR	The Payer SSN in the original payment is not the same as the SSN for the current Payee

GLOSSARY

N = Number

D = Date in the ISO-8601 extended date format, E8601DAw ("yyyy-MM-dd"), e.g. "2011-09-17"

AN = Alphanumeric

MAC = Message Authentication Key

Secret Word = Used in calculating the MAC, unique for each Merchant

Paypage = Payment selection page, where the buyer chooses which payment method to use
